

Exciting! New!

LEISURE-TIME HOMES

of Fir Plywood

YOU'RE REALLY LIVING... WHEN YOU HAVE TWO HOMES

A leisure-time home is easy-to-build
with practical, economical fir plywood

With the trend to shorter work weeks and the urge to get away from crowded city and suburban areas, the word is out: Be prepared for leisure-time living in your *second* home! In these pages you'll find pictures and floor plans of twenty leisure-time cottages and cabins. They are planned to bring you maximum pleasure with minimum floor space. Plan now to use your off hours and vacation time to build one of these uncluttered little cottages, made better, easier and more economically with fir plywood. A little later you'll be swimming and boating with the kids, hunting, fishing or skiing, or just plain loafing in headquarters of your exact choice. Whether you're a master builder or enthusiastic amateur you'll find it easy to provide yourself and family with a fir plywood home-away-from-home. Strong, good-looking fir plywood saves you time, money and effort in creating your second home.

How to order leisure-time home plans

PLANS FOR THE FIVE FEATURED HOMES on pages 3 to 7 are available at many lumber dealers or may be ordered by mail from Douglas Fir Plywood Association, Tacoma 2, Washington for 25c each. Be sure to specify the "Leisure-time Cabin Plan" you want by name. Plans are fully detailed, printed on heavy durable paper and include complete bills of material.

LU-RE-Co HOMES on page 9: see or write to a dealer listed at bottom of the page, or contact a local lumber dealer who is associated with the Lumber Dealers' Research Council.

ADDITIONAL HOMES shown on page 10: write to the plan suppliers listed with the name and number of the cabin or cottage you choose.

Your lumber dealer will help you

After you have your plans for a leisure-time "second home," see your local lumber dealer for the necessary materials, like fir plywood. He can supply you with a cost estimate of the materials you'll need. He will also be pleased to recommend a good builder-contractor nearby to construct your home if you elect not to do-it-yourself.

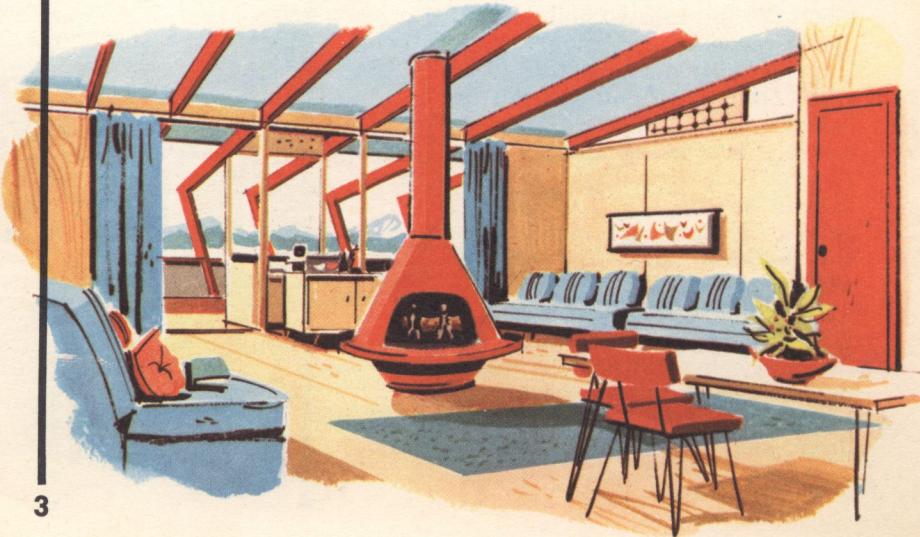

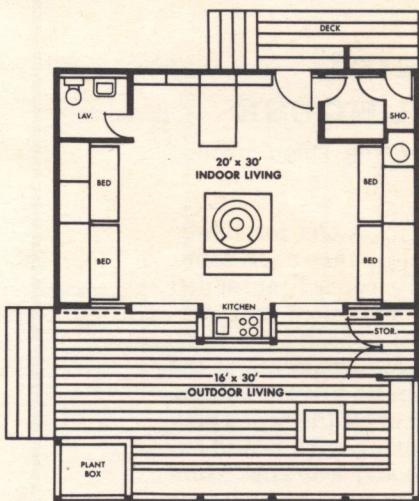

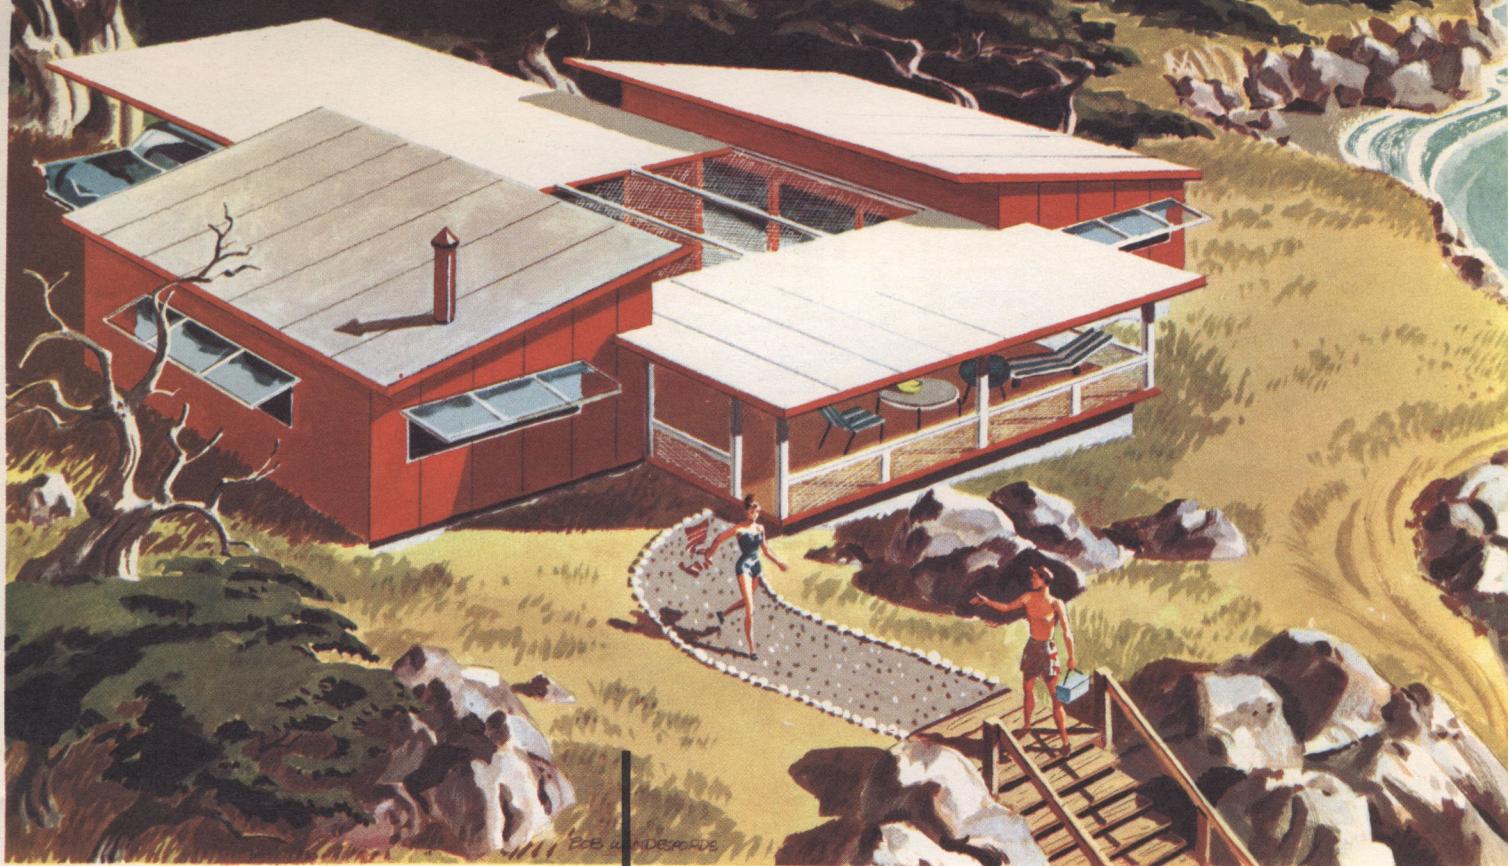

BOB WANDERGORD

WEEKEND BEACH COTTAGE

Frederick Liebhardt, Architect

An entire summer or week-end is fun in this cottage. Designed for a family of five it will sleep eight persons without resorting to sleeping bags. The central fireplace is the heat source and accessory cooking facility. Built-in kitchen divider and corner bath and stall shower leave extra living room. The open rafters, slanting seaward, can be covered for additional shelter. A single thickness of Exterior fir plywood serves as siding, sheathing and interior facing which simplifies construction and saves on materials. Use regular Exterior fir plywood or Exterior plywood with a smooth, fused-resin overlay for better paintability. In years to come you'll praise the durability of modern, all fir plywood construction while enjoying the comfort, individuality and easy maintenance of this modern week-end cottage.

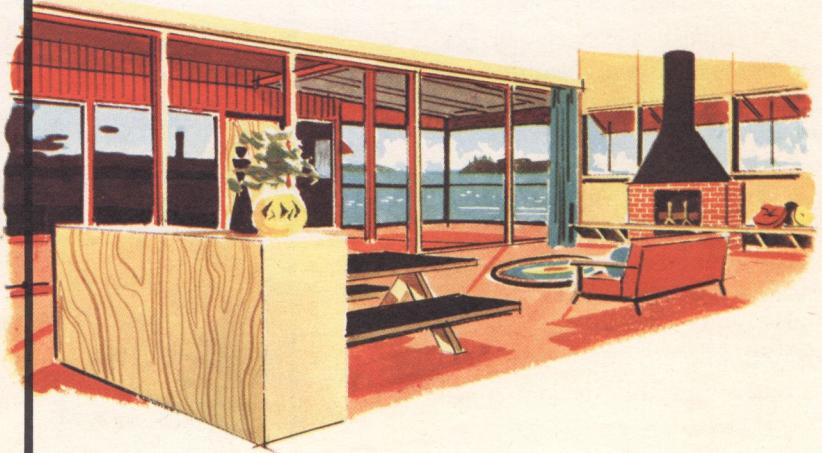

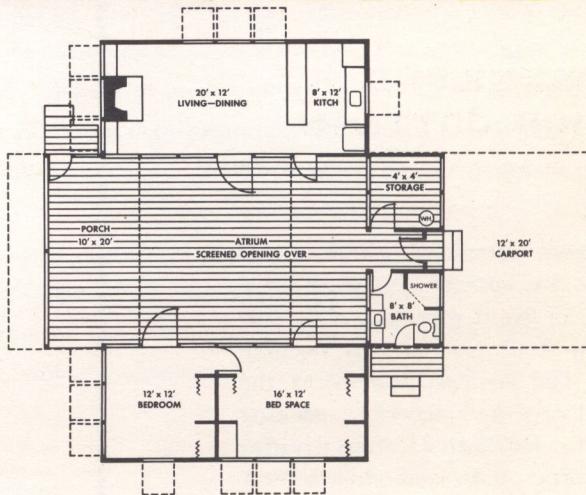

SEASIDE SUMMER HOUSE

Philip Thiel, Architect

Two small cabins — one for living, one for sleeping — face each other across a partly roofed, screened court. Carport, bathroom and storage-utility space opposite the viewing porch complete enclosure of the court. Court can be private garden, barbecue center or off-the-beach play area — contrasting with broad expanses of beach and sea. This "compound" arrangement permits longer season of leisure-time home enjoyment. Designed for a family of four, yet there's plenty of privacy in the sleeping wing for couples. Doors slide open onto courtyard from both living and sleeping areas for spacious informality and easy traffic flow. Outside windows have hinged fir plywood panels — sunshades in summer and close-up shutters in winter. For a relaxed atmosphere and ease of upkeep, interior is unfinished. You can build this home yourself with a little professional help. Fir plywood sheathing and subflooring speed and simplify construction—keep costs down, too.

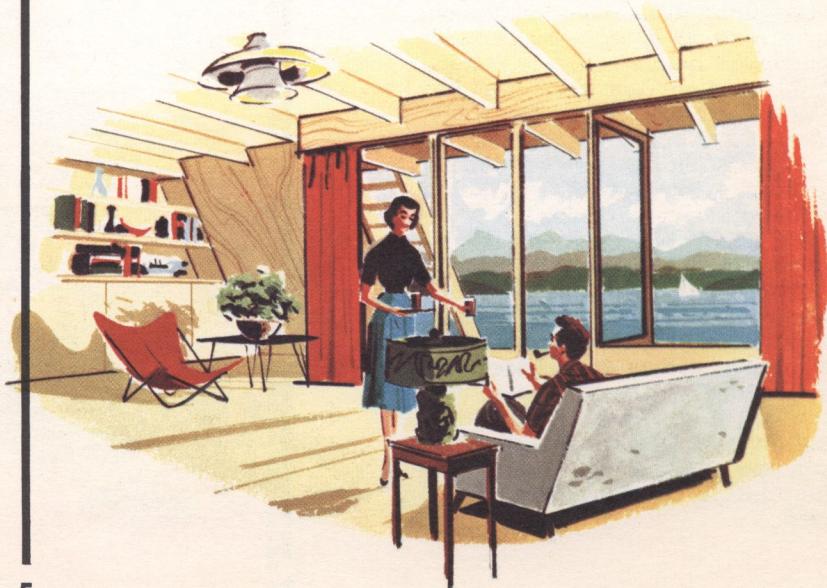

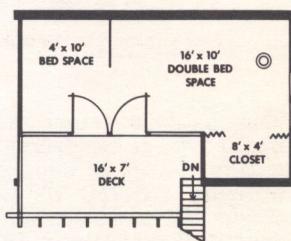

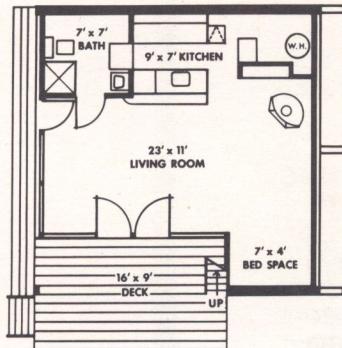

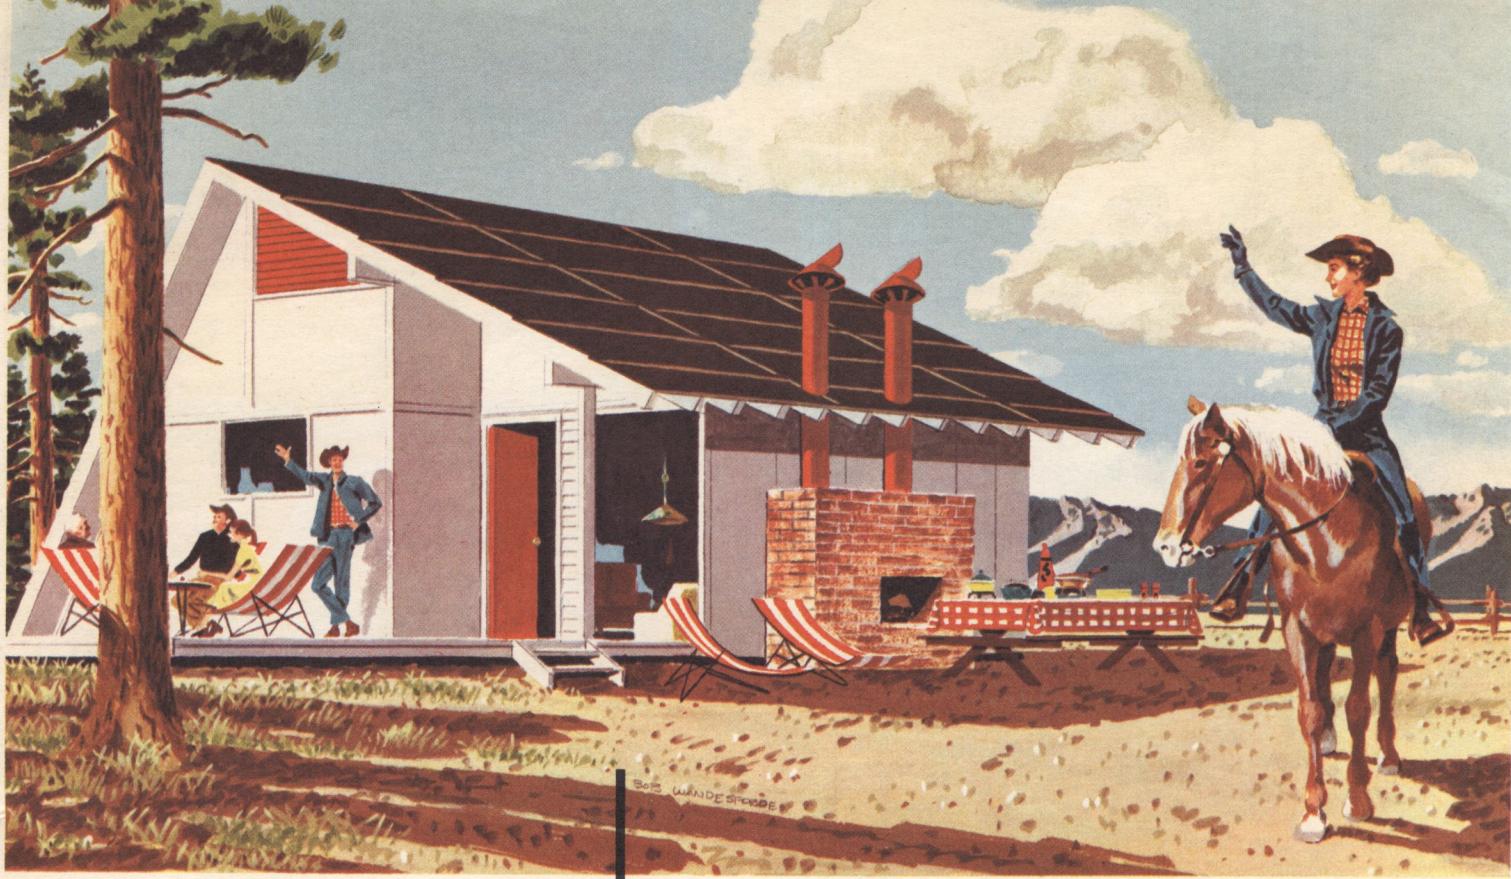

A-FRAME BEACH CABIN

Dr. David T. Hellyer, *Designer-Owner*

If you want a second home that's strikingly different, try this double-deck A-frame style. Although the A-frame has been used for many types of storage and shelters (its origins are in antiquity) this design represents one of its latter-day applications to a dwelling. The structure rests on king-sized base beams supported by nine concrete pilings. The roof of full-size Exterior fir plywood panel "shingles" act as both exterior and interior covering. Properly edge-butted and nailed, the strong, durable plywood panels provide the lateral rigidity that's needed with this type of frame. Texture One-Eleven "grooved" Exterior plywood side sections were nailed-up at owner's town home during the winter for assembly during warm weather on the building site. Two top-deck bedrooms are reached by outside stairway. Porch, living room, built-in kitchen and bathroom fill the first deck. Roof panels and siding were left unfinished to weather to the glistening caste of driftwood.

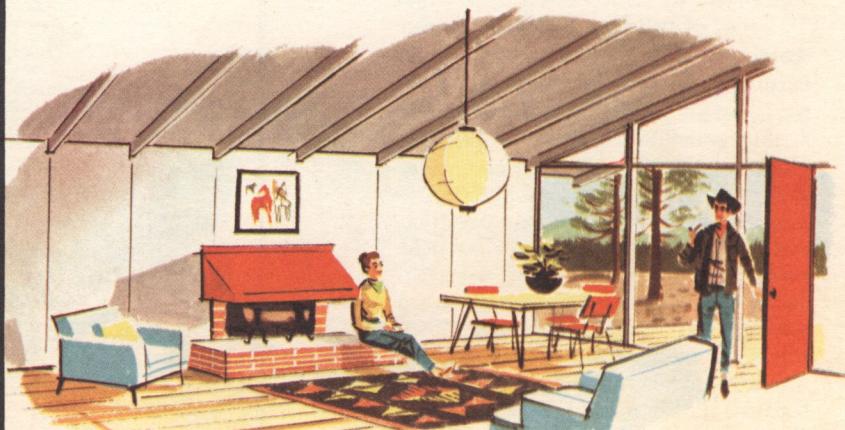

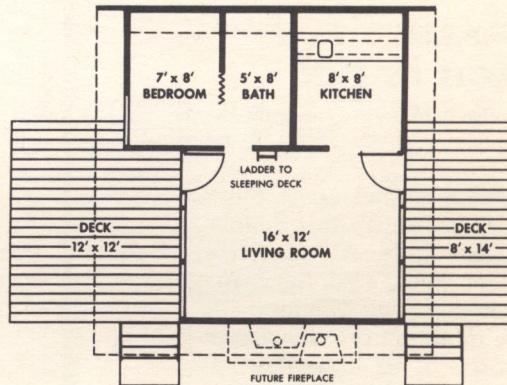

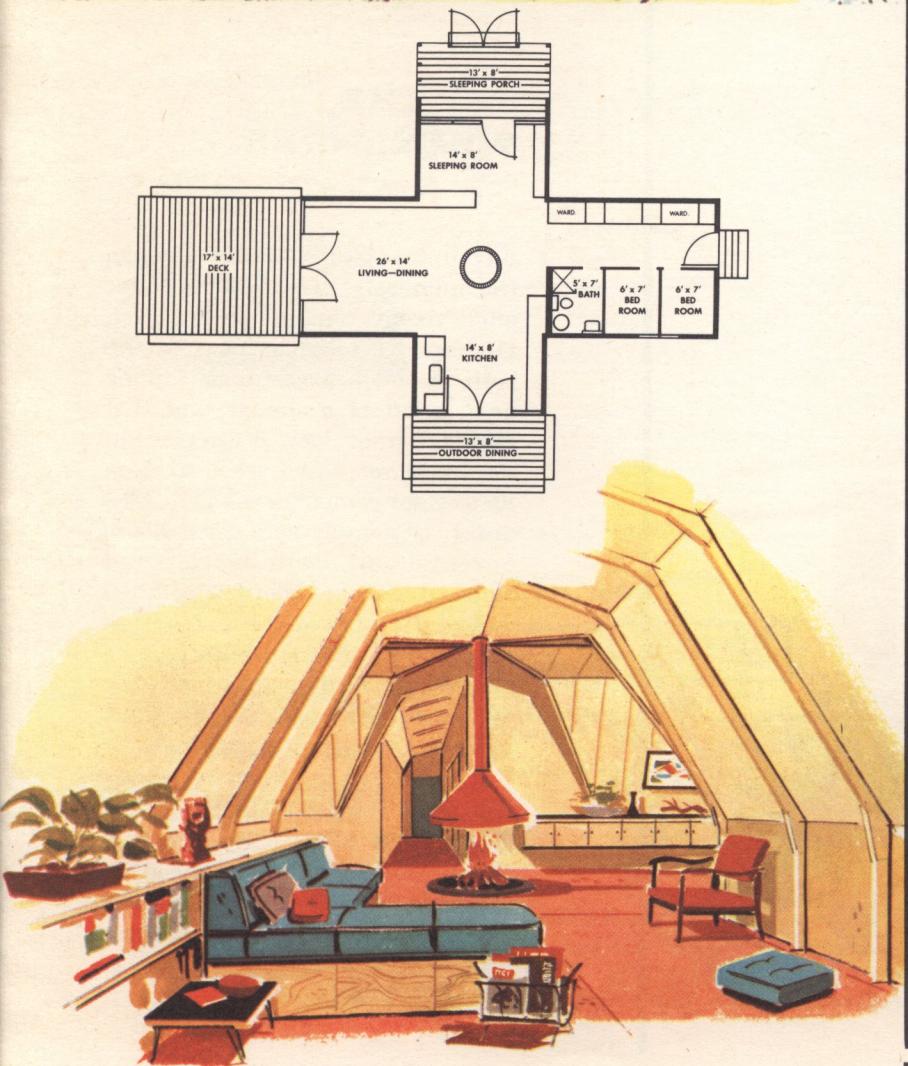

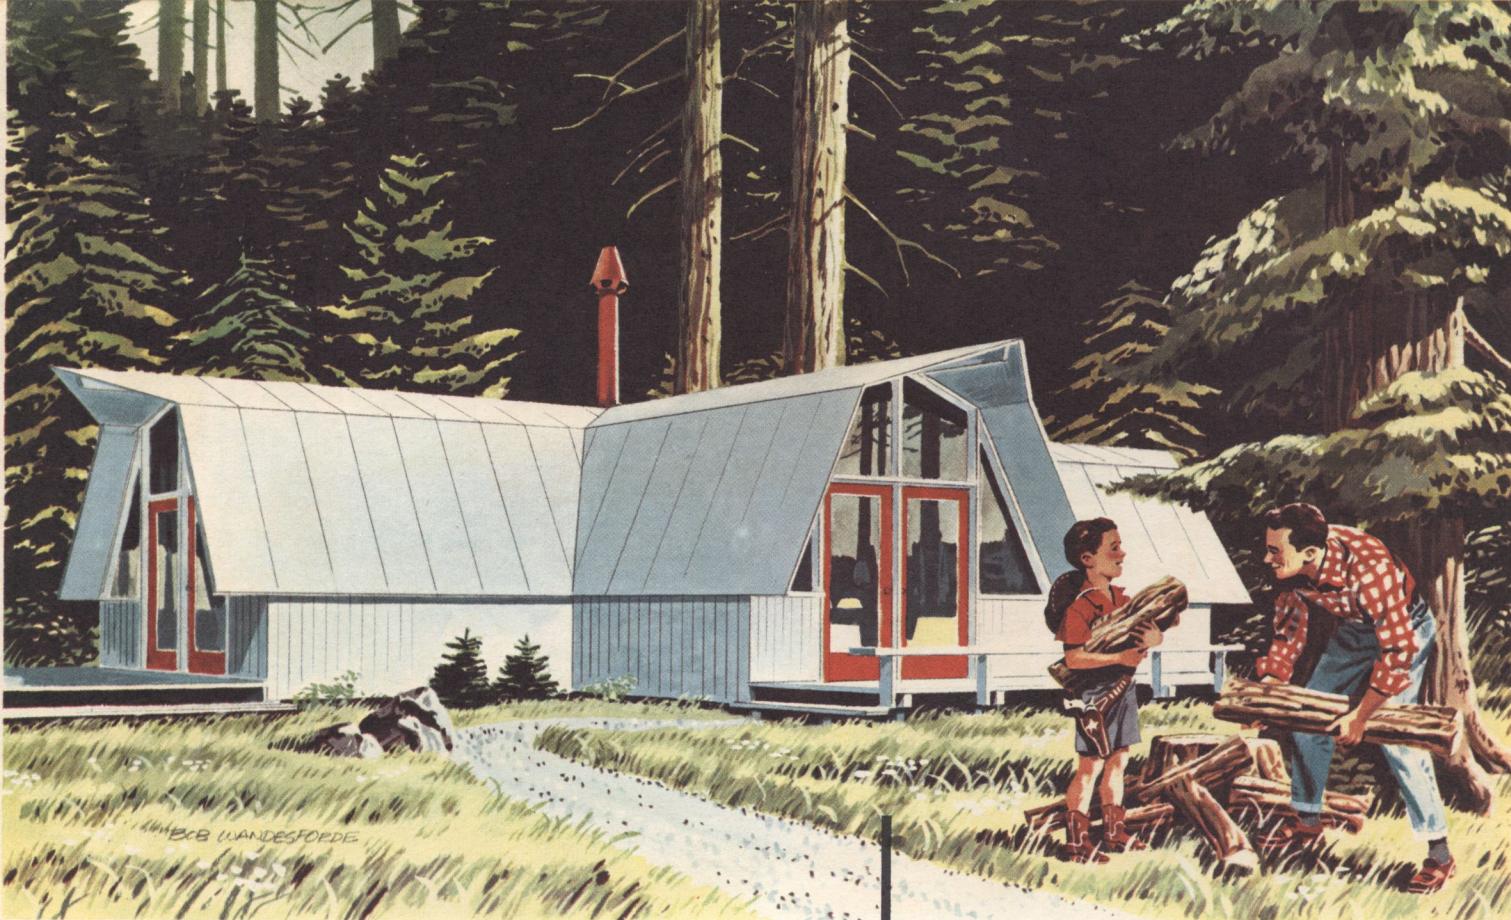

VACATION CABIN

CABIN

Walter D. Widmeyer, Architect

Turning to a rather more conventional type of construction—this vacation cabin is economy-keyed, utilizing Exterior fir plywood for single-wall construction. The peaked roof encloses an open half-attic above kitchen-bath-bedroom side. Attic deck can be used for an extra sleeping area or storage. Expansion in front and rear can include possible dining room, more living room space and another bedroom. This simple yet ample design is pointed toward owner construction. For ease of building, the Exterior fir plywood roof is applied shingle-fashion over joists. Siding is nailed directly to studs with battens over joints, sealed with non-hardening mastic for water-tightness. Siding may be stained or left to weather, relating exterior texture and simple construction more closely to a natural woodsy or shoreside environment. No plumbing, heating or electrical work is included in the basic plan, but can be easily added. By pre-building plywood wall sections at home, you can put this one up fast on a foundation of pre-cast concrete piers.

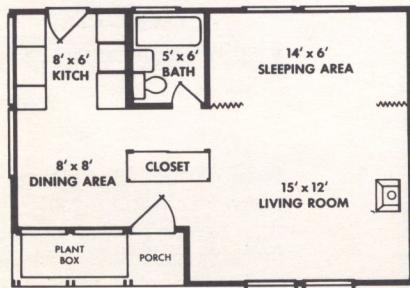

CABIN IN THE WOODS

Alan Liddle, Architect

Reminiscent of a South Seas Maori (New Zealand) rain forest lodge, this novel retreat adapts to either flat site or hillside. Modular system design enables easy application of building panels. Intriguing roof shape is formed of Exterior fir plywood panels, while Texture One-Eleven, "grooved" Exterior plywood, provides handsome and durable siding. New $1\frac{1}{8}$ " thick plywood panels called "2-4-1" combine functions of underlayment and subfloor. You can build this cabin yourself in a couple months' of weekends. Parts can be preassembled in town and brought to the cabin site ready for installation. Skylights bring illumination to cabin interior for heavily wooded locations. Some 952 square feet of interior living space includes kitchen, two small bedrooms, larger bedroom, bath, screened sleeping porch and living room. Outdoor decked areas can be added to suit your needs. The strong steeply pitched Exterior fir plywood roof will support heavy snows, resist high winds.

BOB WANDERSFORD

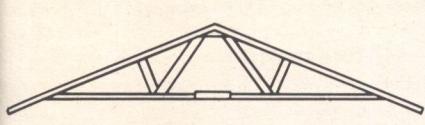

THE WEEKENDER

Home Building Plan Service

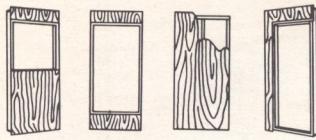

A complete year-round residence, the modestly priced Weekender offers roomy comfort. Its compact, U-shaped kitchen is next to the bath. A small, glass-fronted dining area is left of a storage unit that faces the front door. A fire place in the living room and space to sleep up to eight completes the plan. The design is suitable as a guest house or rental unit. Building time and material costs are kept low with the use of fir plywood construction throughout. The modular system affords the budget-minded home craftsman the opportunity to buy and build piecemeal. Later the units can be trucked to the site for assembly. Send \$1.00 to HOME BUILDING PLAN SERVICE, 2454 N.E. Sandy Blvd., Portland, Oregon for complete "How-to-Build" information and plan catalog describing ten other Weekender building plans.

LU-RE-CO

PRE-ASSEMBLED, READY-TO-ERECT VACATION HOMES

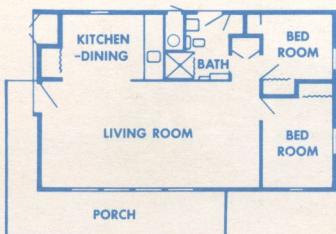

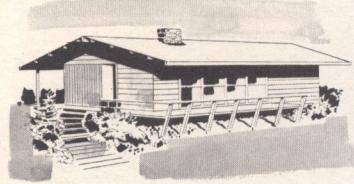

ROOF TRUSS

WALL PANEL

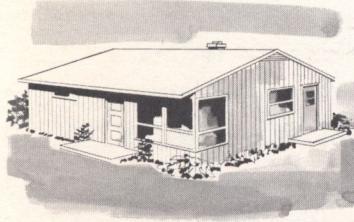

BARR'S DELUXE CABIN

Leisure living in a 32' x 20' unit developed by Barr Lumber Co.

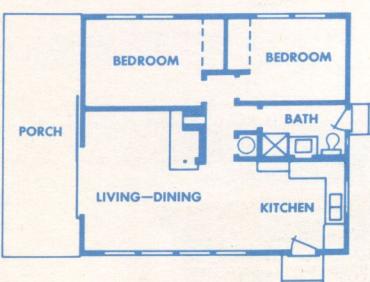

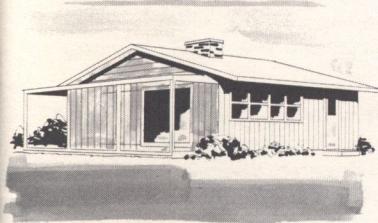

SUMMER COTTAGE

For relaxed living choose this 20' x 24' summer cottage. Home Lumber & Supply Co.

HOLIDAY COTTAGE

A handsome summer cottage that's a home away from home. National Plans Service, Inc., 1700 W. Hubbard St., Chicago 22, Ill.

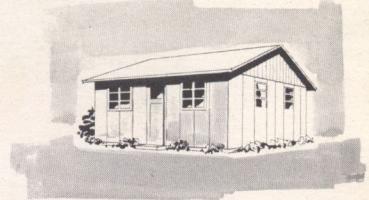

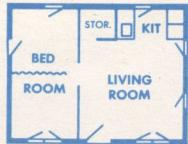

Lu-Re-Co is the trade name given a modular construction system developed by the Small Homes Council, University of Illinois, under a research grant from the Lumber Dealers Research Council. The Council is an organization devoted to research in the construction industry, and it licenses the manufacture of Lu-Re-Co components by lumber dealers. The system consists of pre-assembled building panels and trusses made of fir plywood or other building materials. Plywood roof decking and subflooring complete the system. Your Lu-Re-Co dealer can build the component parts you'll need in his own yard. Later they can be trucked to your site for immediate erection.

To the left is an illustration of typical components used in the Lu-Re-Co method. Plywood gives the system strength, rigidity, and greater economy through lower maintenance, long life.

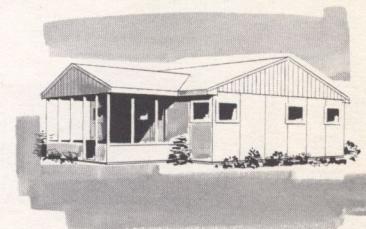

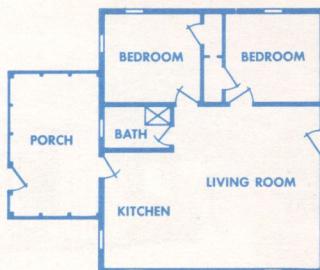

THE MILLE LAC

This 16' x 20' cabin is economical. Delong Lumber Co.

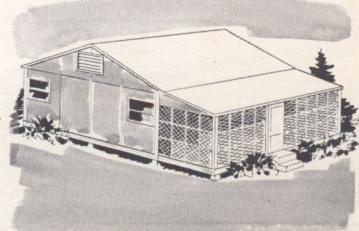

THE PAWNEE

Need room? Select this 24' x 28' cabin by Oakes & McClelland.

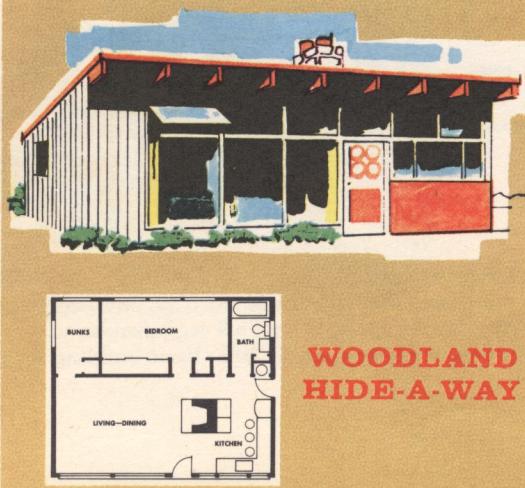

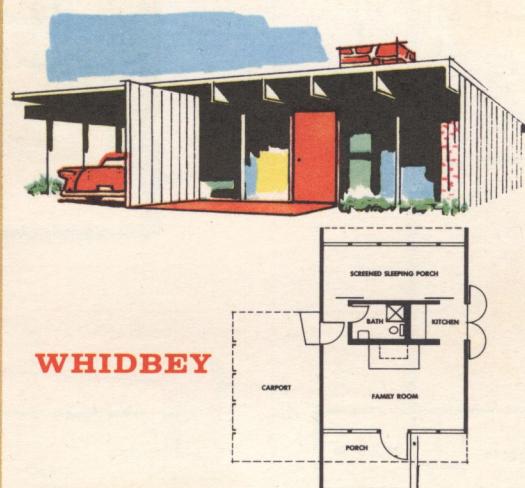

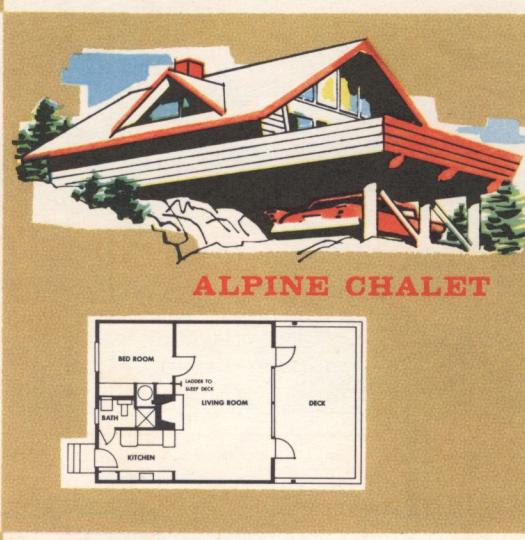

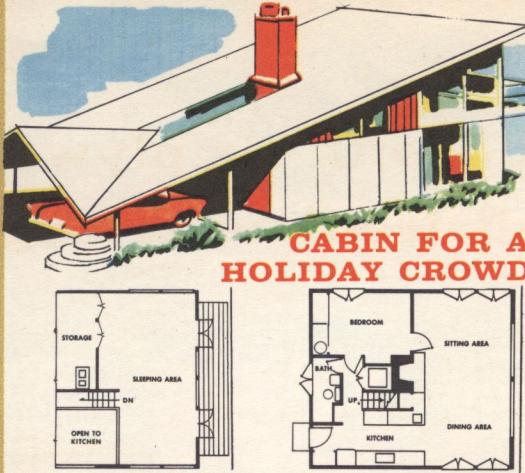

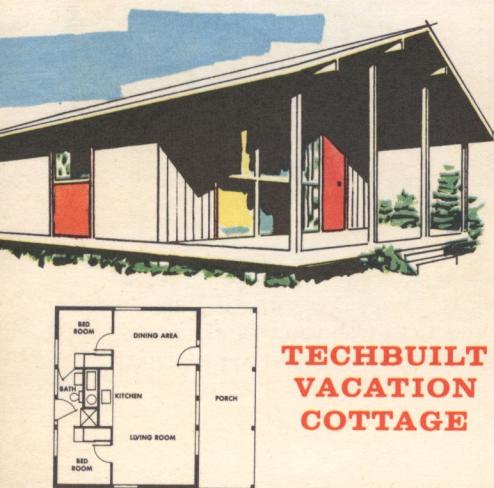

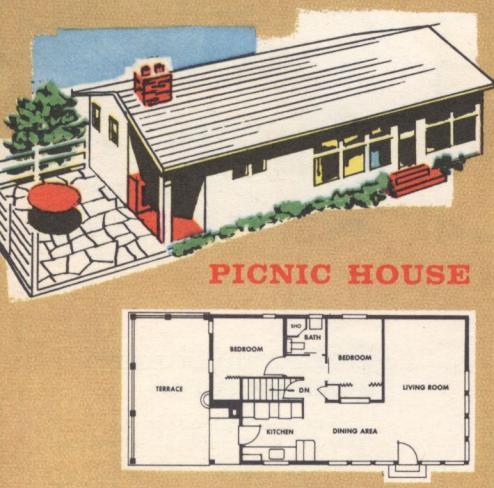

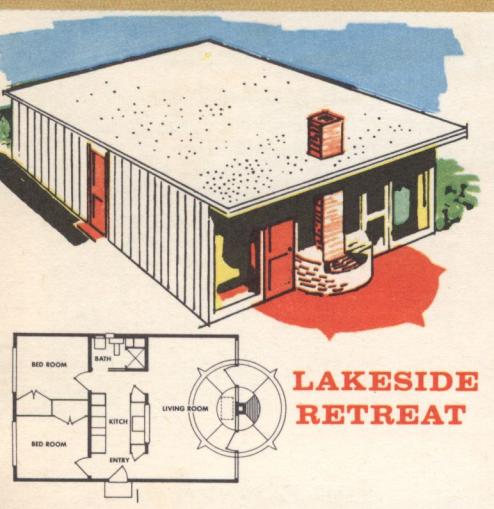

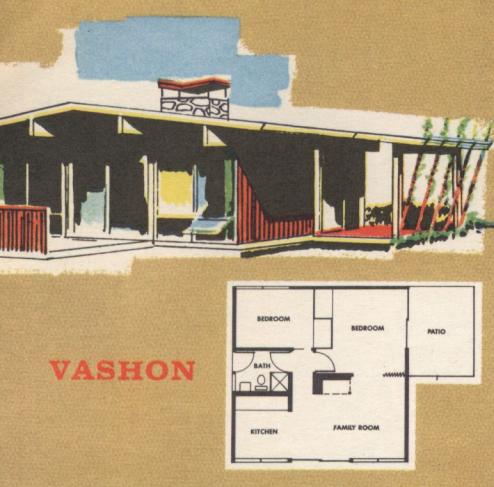

THE PATRICK-REED SUMMER HOME

Enjoy the screened-in porch of this 20' x 24' unit. Patrick-Reed Lumber Co.

LU-RE-CO DEALERS: The homes pictured here are just a few of the many plans offered by the 1300 Lu-Re-Co dealers located throughout the country. For additional information write the Lumber Dealers Research Council, Suite 302—Ring Building, 18th & "M" Streets, N.W., Washington, D.C. This organization may be able to furnish you with the name and location of a nearby Lu-Re-Co dealer who can help you with your basic building supply needs for structural components.

Here are more home plans to whet your appetite for Leisure-time living

The latitude of styles and degrees of spaciousness in weekend and vacation homes are as various as the many places and ways we spend our leisure time. On this page are some additional pert and practical cottages to help your thinking. You may find the "second home" of your choice among them. But whether you plan a simple four-walled enclosure by the sea or a palace in the pines, you'll find strong, durable, naturally beautiful fir plywood can help you build faster, easier and within the bounds of most any family's economy.

Plans or further information about the homes pictured at left can be obtained by writing to these designers:

Robt. A. Jorgensen, Architect,
P. O. Box 245, Edmonds, Washington. He designed: Cabin For A Holiday Crowd, Lakeside Retreat, Alpine Chalet, Picnic House, and Woodland Hideaway.

Jerry Gropp, Architect, of 17238 10th Northwest, Seattle 77, Washington, designed the Vashon and the Whidbey.

TECHBUILT, INC., of 1692 Massachusetts Ave., Lexington 73, Massachusetts will supply you with information on this pre-fabricated unit.

Plan and build with fir plywood for Leisure-time Living accessories

Whether or not your leisure-time plans include a second home, there are hosts of other easy-to-build, enjoyable projects right up "plywood alley". Fir plywood's large panel size, light weight and workability have endeared it as a preferred building material to millions of leisure-loving folks all over. When building with plywood you need only ordinary tools and average skill. Plans and specifications for the life-enriching projects pictured on this page — and loads of others, too — are available by writing the Douglas Fir Plywood Association.

If you are all boated-up, so to speak, an easy-to-build fir plywood boathouse will protect your water-borne pride-and-joy and add to the appearance of your leisure time layout.

A versatile craft is the outboard cabin cruiser—ideal for fishing, touring, water skiing.

Here's a smart plywood carry-all that doubles as a roving buffet and serving table.

If you have a big boat, you need a small boat. If you have no boat, why not try this boat? It's an eight-foot pram of waterproof Exterior plywood.

This kewpie-sized sailboat is amazingly seaworthy. Fun for sailors of all ages who like to "go it alone."

You'll find a lot of uses for fir plywood to bring more style to your leisure living. This wind-and-sun screen is one of the "nice touches" you can add.

Specify

Fir Plywood in the construction of your Leisure Time Home

Fir plywood is "made" for leisure time home construction. Its cross-bonded veneers of real wood give it two-way strength and rigidity; make it relatively split and puncture-proof. A combination found only in natural wood panels.

But there's something else different about fir plywood. When it has the DFPA TESTED QUALITY stamp you may be sure the panel you buy has been produced under rigid industry standards maintained by continuous inspection. Look for the symbol. It's an integral part of the grade-trademark placed on each panel by the manufacturer.

Two Types to Choose From

Fir Plywood comes in two types:

EXTERIOR: The glue that bonds the veneers is completely waterproof, stronger than the wood itself.

INTERIOR: Made with highly moisture-resistant but not waterproof glue.

Types and appearance grades commonly available at most lumber dealer stores are shown in the selection chart at the right. Before you begin to build your cabin review the materials list — shown on the plan you use — with your lumber dealer or builder. This will assure you proper selection of plywood and other materials for the most satisfactory results.

FIR PLYWOOD TYPE AND GRADE SELECTION CHART

EXTERIOR TYPE FOR OUTDOOR JOBS*

EXT-DFPA-A-A <small>DOUGLAS FIR CS 45-55</small>	Where the appearance of both sides of the panel is important—i.e., fences, carports, etc.	EXT-DFPA-A-C <small>DOUGLAS FIR CS 45-55</small>	DFPA TESTED QUALITY	Where only one side of good appearance is desired—i.e., siding, and outdoor shelters.
For decorative appearance use Texture One-Eleven, Striated or Brushed plywood.				For economy specify C-C EXT-DFPA. (unsanded)

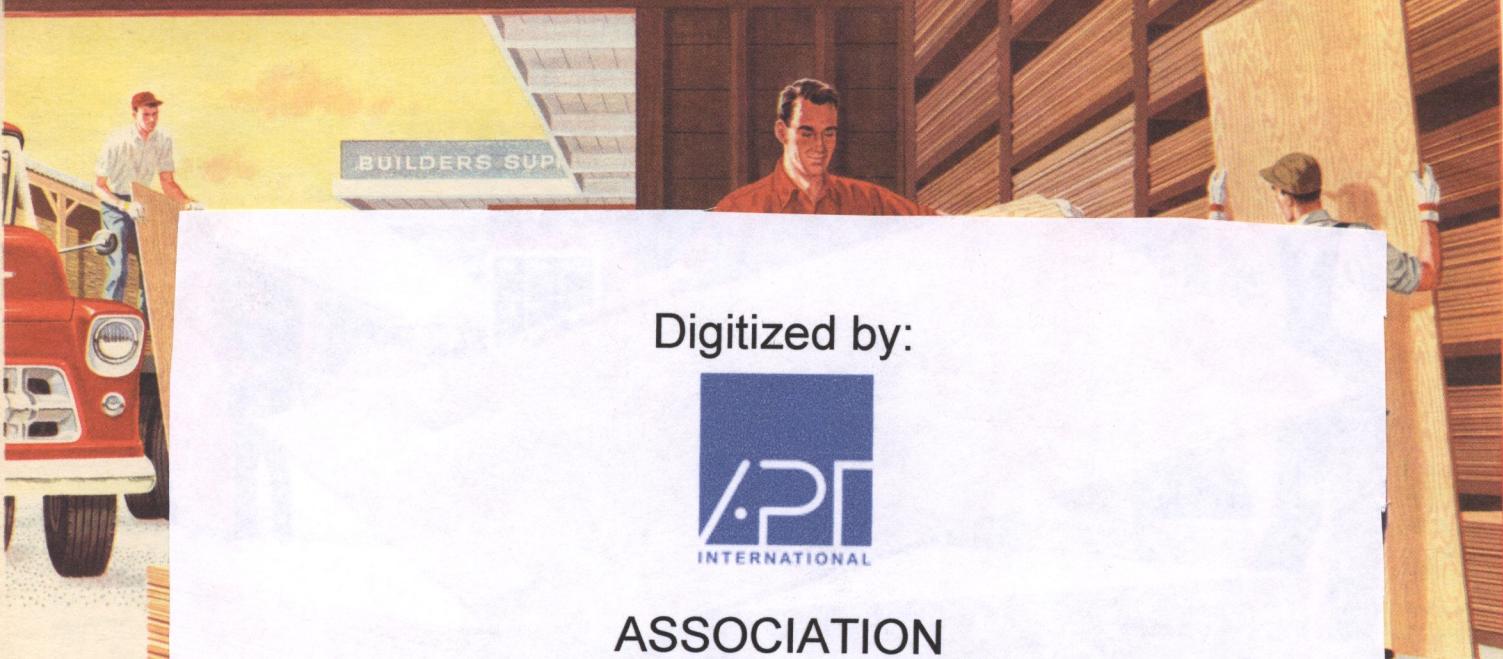

* Or for inside applications where unusual moisture conditions may exist; check with your lumber dealer where a doubt exists.

INTERIOR TYPE FOR INDOOR USES

INT-DFPA-A-A <small>DOUGLAS FIR CS 45-55</small>	For interior applications where both sides will be viewed —i.e., cabinet doors, etc.	INT-DFPA-A-D <small>DOUGLAS FIR CS 45-55</small>	DFPA TESTED QUALITY	For interior applications where only one side will be seen—i.e., paneling, built-ins, etc.
PLYSCORD <small>STRUC-INT C-D DOUGLAS FIR CS 45-55</small>				Same as PlyScord, but with waterproof glue. Not normally a substitute for exterior fir plywood.
